

Why Doesn't Intertech have an SDS for Finished Products?

As specified by the Hazard Communication Standard, products manufactured as "articles" are exempt from requirements of the MSDS standard. Our manufactured plastic products do not include an SDS in the packaging, since they are considered whole units and cannot pose a risk.

While the majority of products are made from raw materials, once formed into a whole unit, the material cannot be spilled, consumed, ingested or inhaled. Any potentially hazardous nature of the raw materials are rendered irrelevant once they are fabricated into the finished device. The material composition SDS is still kept on file for when our customers have questions

At Intertech Plastics, this is true for all of our parts.

We have approved 2 different suppliers of FDA approved polypropylene, to ensure an uninterrupted supply chain for our products. This folder will be updated if we need to switch to our backup supplier.

If there are any other documents (such as specific colorant info) that you require, please submit a request to:

Quality@intertechplastics.com

Thank you.
